Excerpt: . . . as dealing with whole numbers in the same notation. The process is just the same, only we must be careful to put the decimal point in the right place. So, however, we must with whole numbers, only we do not have to actually write a decimal point in their case (except in the quotient perhaps); but we always have to be careful to interpret the quotient as meaning hundreds or thousands, or whatever it is, correctly, and that is essentially the same thing as attending to the position of the decimal point. For instance, divide 729 by 14. The last figure in the quotient is not exactly 3, but that is the nearest, and it is quite time to stop, as we have already reached the extravagant accuracy of seven significant figures. If we wanted to go on, however, there is not the slightest difficulty. We simply go on till the remainder is negligible, not because it is itself numerically small, but because it occurs so many decimal places away from the left hand significant figure that only an utterly insignificant fraction is left. For instance, in the above sum, the last remainder which is indicated, as giving the quotient 3 in the fifth decimal place of the quotient, is really-00040, and the multiplication of the divisor by 3 would give-00042, which leaves a remainder of-2 in the fifth decimal place, to be divided by 14; with a result wholly trifling. In the above sum the decimal points and...
